# Introduction to Remotely Operated and Autonomous Vehicles Society for Underwater Technology

By:

Peter Moles

Chief Technologist

Oceaneering International, Inc

# Presentation Overview

---

- ROVs
  - Business
  - History
  - Key Hardware
  - Tools
- AUVs
  - Business
  - Key Hardware
  - Tools
- ASVs

- Remotely Operated Vehicles (ROV)
  - Controlled from the surface via an umbilical
- Autonomous Underwater Vehicles (AUV)
  - Preprogrammed operations – no input from operator , or supervised operations
  - In military applications, AUVs are often referred as unmanned undersea vehicles (UUVs)
- Autonomous Surface Vessels (ASV)
  - Surface unmanned vessel
  - Preprogrammed operations – no input from operator, or supervised operation

# Remotely Operated Vehicles (ROVs)

# Harsh and Dangerous Environments

- Extreme Weather and Temperature
- Vessel Movement
- High Voltages (5000+VAC)
- High Pressures (15000+psi)
- Heavy Loads
- Divers...

# Bad Things Happen

# Typical ROV Services

- **Drill Support**

- Mud /cuttings /concrete management from well, template or manifold
- Routine inspection, monitoring, cleaning and intervention tasks on and around the BOP
- Alignment and leveling during template or manifold installation

- **Well and Subsea Completion**

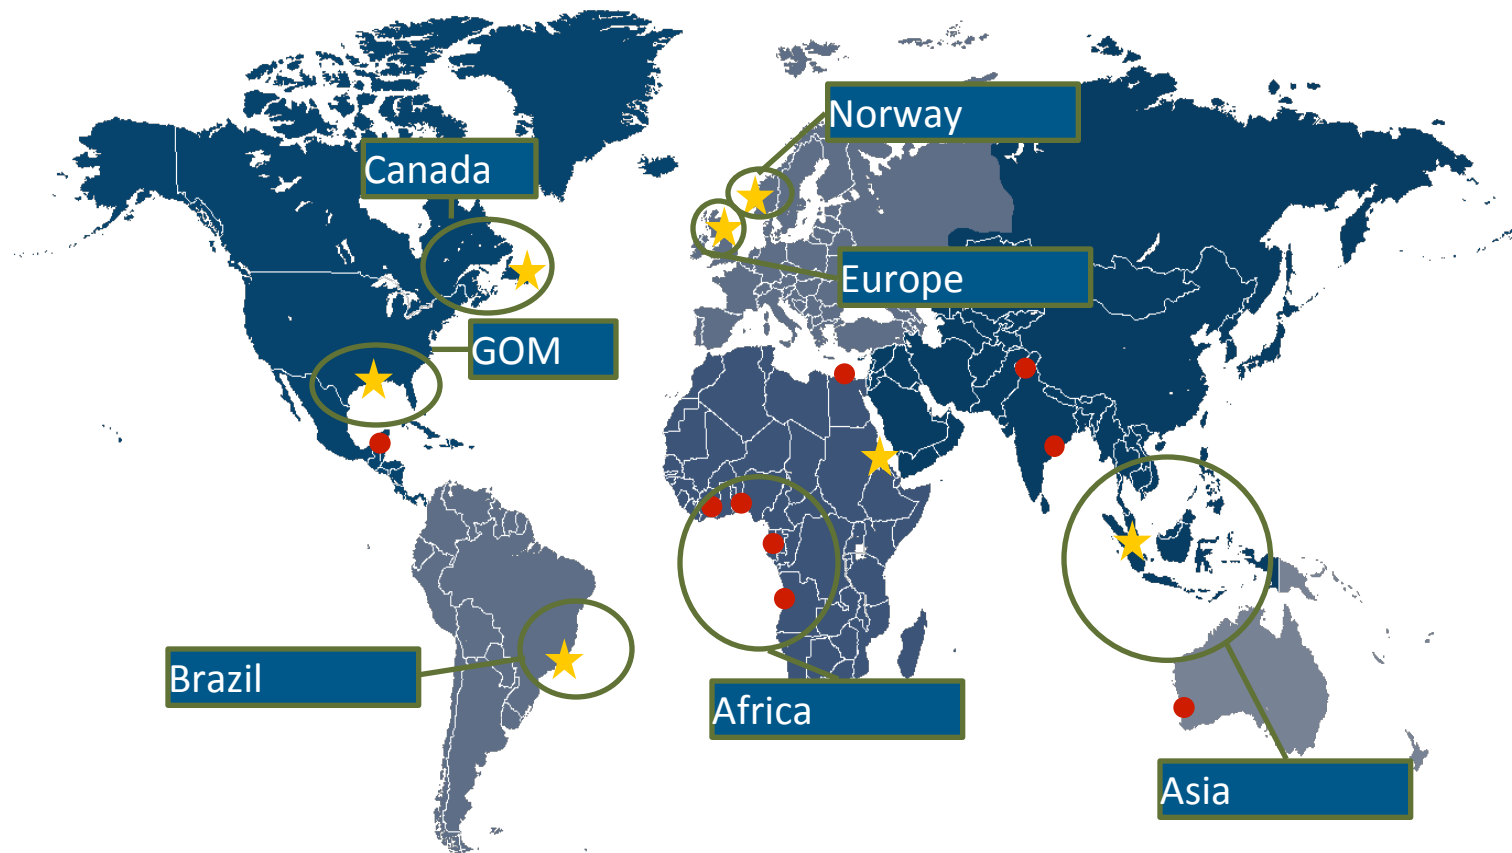

- Construction support - trees, manifolds, jumper, flowlines, umbilicals, etc.
- Monitoring and control for commissioning of well

- **Inspection, Maintenance and Repair**

- Light well Intervention - stimulation, remediation, P&A, tie-backs Installations - flowlines and umbilicals
- Pipeline Repairs, Strake Installations, Hydrotesting, Choke / Pod Change-outs
- Mattress Installations and Crossings of Pipelines, Flowlines, and Umbilicals

# Where ROVs Operate Today

# The ROV Crew

- Crew consists of 3-men per 12-hour shift x 7 days / week
  - 1 x Supervisor
  - 2 x Pilot (Mechanical and Electrical Technicians)
- Typical tour is 28-days (with 28-days off)
- Personnel Skill Requirements
  - Technical: Electronics, Electrical, Computers, Hydraulics, Mechanics
  - Team Dynamics
  - Safety Conscious

# ROV Training

# Commercial

- ROV services
  - Typically contracted directly with Operator
  - Charged on a day rate basis
  - Transit rates: manned and unmanned rates
  - System mobilization/demobilization costs
- Day Rates broken up as follows:
  - Crewing for 12 hour or 24 hours operations
  - Single system or dual systems
  - Dedicated crews
- Hardware
  - LARS - Heave Compensation, Wind Shelter, Garage
  - Tooling Leased - standard tooling, skids, specialty systems
  - Tool Pool - managed tool issuance and maintenance/repair

# ROV History: Commercial – 1950's

- First ROV...
- Dimitri Rebikoff developed the "Poodle" in 1952
- Camera & Lights/Strobe specialist
- **Developed hardware to support Jacque Cousteau expeditions**
- Pegasus diver vehicle

# ROV History: Military Work Class ROVs

## 1950's – 1960's

- **Military Applications** – torpedo recoveries
- **Electric thrusters** for propulsion
- **Camera and lights**
- **“Grabber Manipulator”** specifically designed to retrieve exercise torpedoes
- **1966 Palomares B-52 Plane Crash** nuclear bomb recovery (2900ft)
- **1973 Pisces submersible** pilots rescue of Cork, Ireland (minutes to spare)

# ROV History: Observation Class ROVs

## 1970's – 1980's

- TREC - 1<sup>st</sup> Generation *Inspection ROV*
- **Air compensated technology**
- **Electric** motors were 1 hp **drill motors**
- Live Boat Launch/Recover System (No TMS)

- RCV-225 /150
- RC225 Torpedo Tubes
- 'State of the art' ROVs
- 4 x 150Vdc **Electric** Thrusters  
- Vertrans and Axial
- Side Entry (Cage) TMS  
Launch/Recovery System
- **SIT Camera with P&T**

# ROV History: Work Class ROVs

## 1970's – 1980's

- Ametek **Scorpio** first commercially available **Work Class** ROV
- **20 HP Hydraulic**
- **Oil Compensated**
- Innerspace Thrusters
- B&W and Color Cameras
- Live Boat Launch/Recover System (no TMS)

- **TROV**
- **1,000 meter depth rating**
- **Use 1 x 7F and 1 x 5F manipulators**
- B&W and Color Cameras
- 40 hp Electric Thrusters - Constant RPM / **Variable Pitch**
- **Variable Ballast -Scuba bottle for ballast air supply**
- Live Boat Launch / Recovery System (No TMS)

# ROV History: Work Class ROVs

## 1980s-1990s

- **ISE Hydra 2500**
- **2500** meter Depth rating
- **30 hp Power**
- Side Entry (Cage) TMS
- **High Voltage** ROV Systems (1600 Vac)
- 1st Commercial ROV using **Fiber Optics**
- **Reliable systems**

- Oceaneering **Magnum** and **Millennium** ROVs
- 3000 Meter Depth Rating
- **100** hp Hydraulic
- Side Entry (Cage) TMS
- Industry standard
- **Integrated into hardware and operations**

# Today - Types of ROV's

## Eyeball ROV

- Observation
- Light powered
- Lights and Cameras
- <500m depth

## Light Workclass

- Light IMR
- 5F Manipulator
- 3km depth
- Operate standard tools

## Heavy / Workclass ROV

- Heavy IMR
- Hydraulic
- 200-300 HP
- Power and operate heavy tools
- 4km depth

# Key Subsea Technology - Pressure Compensation

**Compensation:** Maintaining system pressure over ambient pressure

# Key Subsea Technology - Buoyancy

**Syntactic Foam:** “ A class of material with pre-formed hollow glass spheres held in a polyester or epoxy binder”

Depth (m)	Density (lbs/ft <sup>3</sup> )	Buoyancy Material	Volume float 2500 lbs load (ft <sup>3</sup> )	Foam Weight (lbs)
200	14	Resin/ Air	50	700
500	20		57	1140
500	20	Resin/ Polymer Macrospheres	57	1140
1000	24		63	1512
1000	24-28	Resin/ Glass Microspheres (diff psi)	66	1716
3000	28-32		74	2220
4000	34		83	2822
6000	36-40		96	3648

# Review of ROV components and hardware

# High Definition Camera Systems

- HDTV Video
- Video overlay
- Digital recording
- Streaming capable
- 4K Video
- 3D Video

# Types of Manipulators

- 5 Function and 7 Functions
- Rate Feed - each individual joint controlled with simple on / off commands
- Spatial Correspondent (SC) - manipulator slave mimics movement of master arm on surface
- Hydraulic and Electric powered
  - Hydraulic dramatically higher loads: 500lbs@7ft vs. 85lbs@6ft for electric

# Navigation

- Obstacle avoidance – Sonar / Imaging
- Attitude and Heading Reference System (AHRS)
- Distance from bottom - Altimeter
- Local movements - DVL and INS

Doppler Velocity Log (DVL)

Inertial Navigation Sensor (INS)

# Key Subsea Technology - Navigation

- Subsea Positioning – ROV, TMS, Hardware
  - Short, Ultra-Short and Long Baseline Systems

Long Baseline

Short Baseline

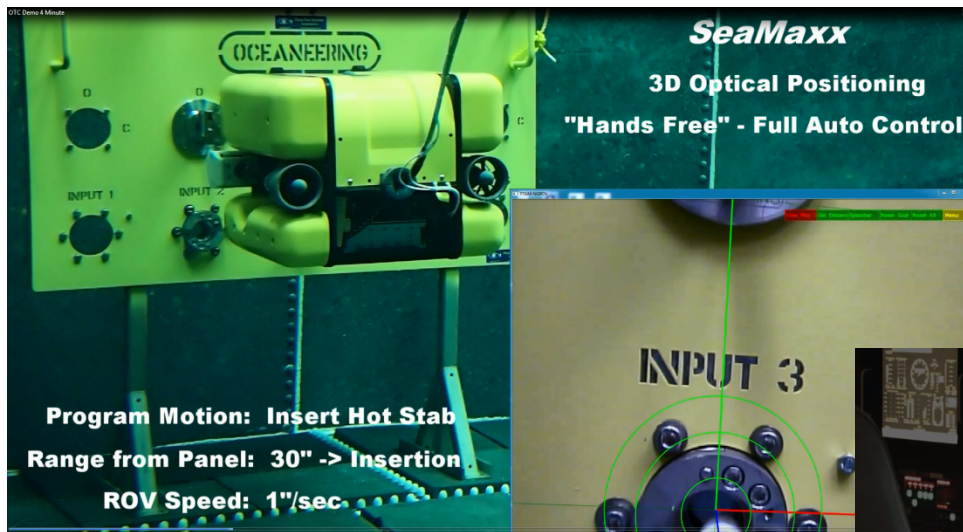

“Boxing -in” LBL Transponders

Ultra-Short Baseline

# Control - Pilot Aids

# Major Components of ROV System

## *Installed on a Vessel*

# Key Subsea Technology: Tophat vs Side Entry Cage

- Unlimited Skid Sizes
- Simple ROV + TMS Access on deck
- Difficult Docking & Dead ROV Recovery

- Lower Center of Gravity
- Greater Protection - Increased Weather Window
- Tool Platform
- Difficult access on deck

# Umbilical

- Umbilical permits deployment of TMS to depth
- Provides path for power and control data to/from the TMS
- Fiber Optic and Electrical Slip rings

# Tether

- Tether decouples motion of Vessel/TMS from ROV
- Provides path for power and control data to/from the ROV
- Tether stored on TMS mounted drum
- Fiber Optic and Electrical Slip Rings

# Control Consoles (Old and New)

# Launch and Recovery

# Over the Side

- Overboarding A-frame
- Traditional launch and recovery method
- Appropriate for short draft vessels
- Auto rotate docking head to align TMS/ROV during recovery
- Portable

# Cursor Rail System

- Cursor systems for high draft vessels
- Stability via rail or guide wires
- Cursor funnel guides umbilical safely away from vessel hull and keel

# Guide Wire Cursor System

- Guide wires provide stability around vessel appendages
- Fixed A-frame structures
- Retractable doors for access and work deck

# Subsea Intervention

# Subsea Intervention - Manipulator Tools

Trend: Hydraulic going Electric

# Subsea Intervention – Skid Supported Systems

BOP Intervention Skid

Dredging Skid

Auxiliary Hydraulic Power Unit Skid

Fluid Intervention Skids

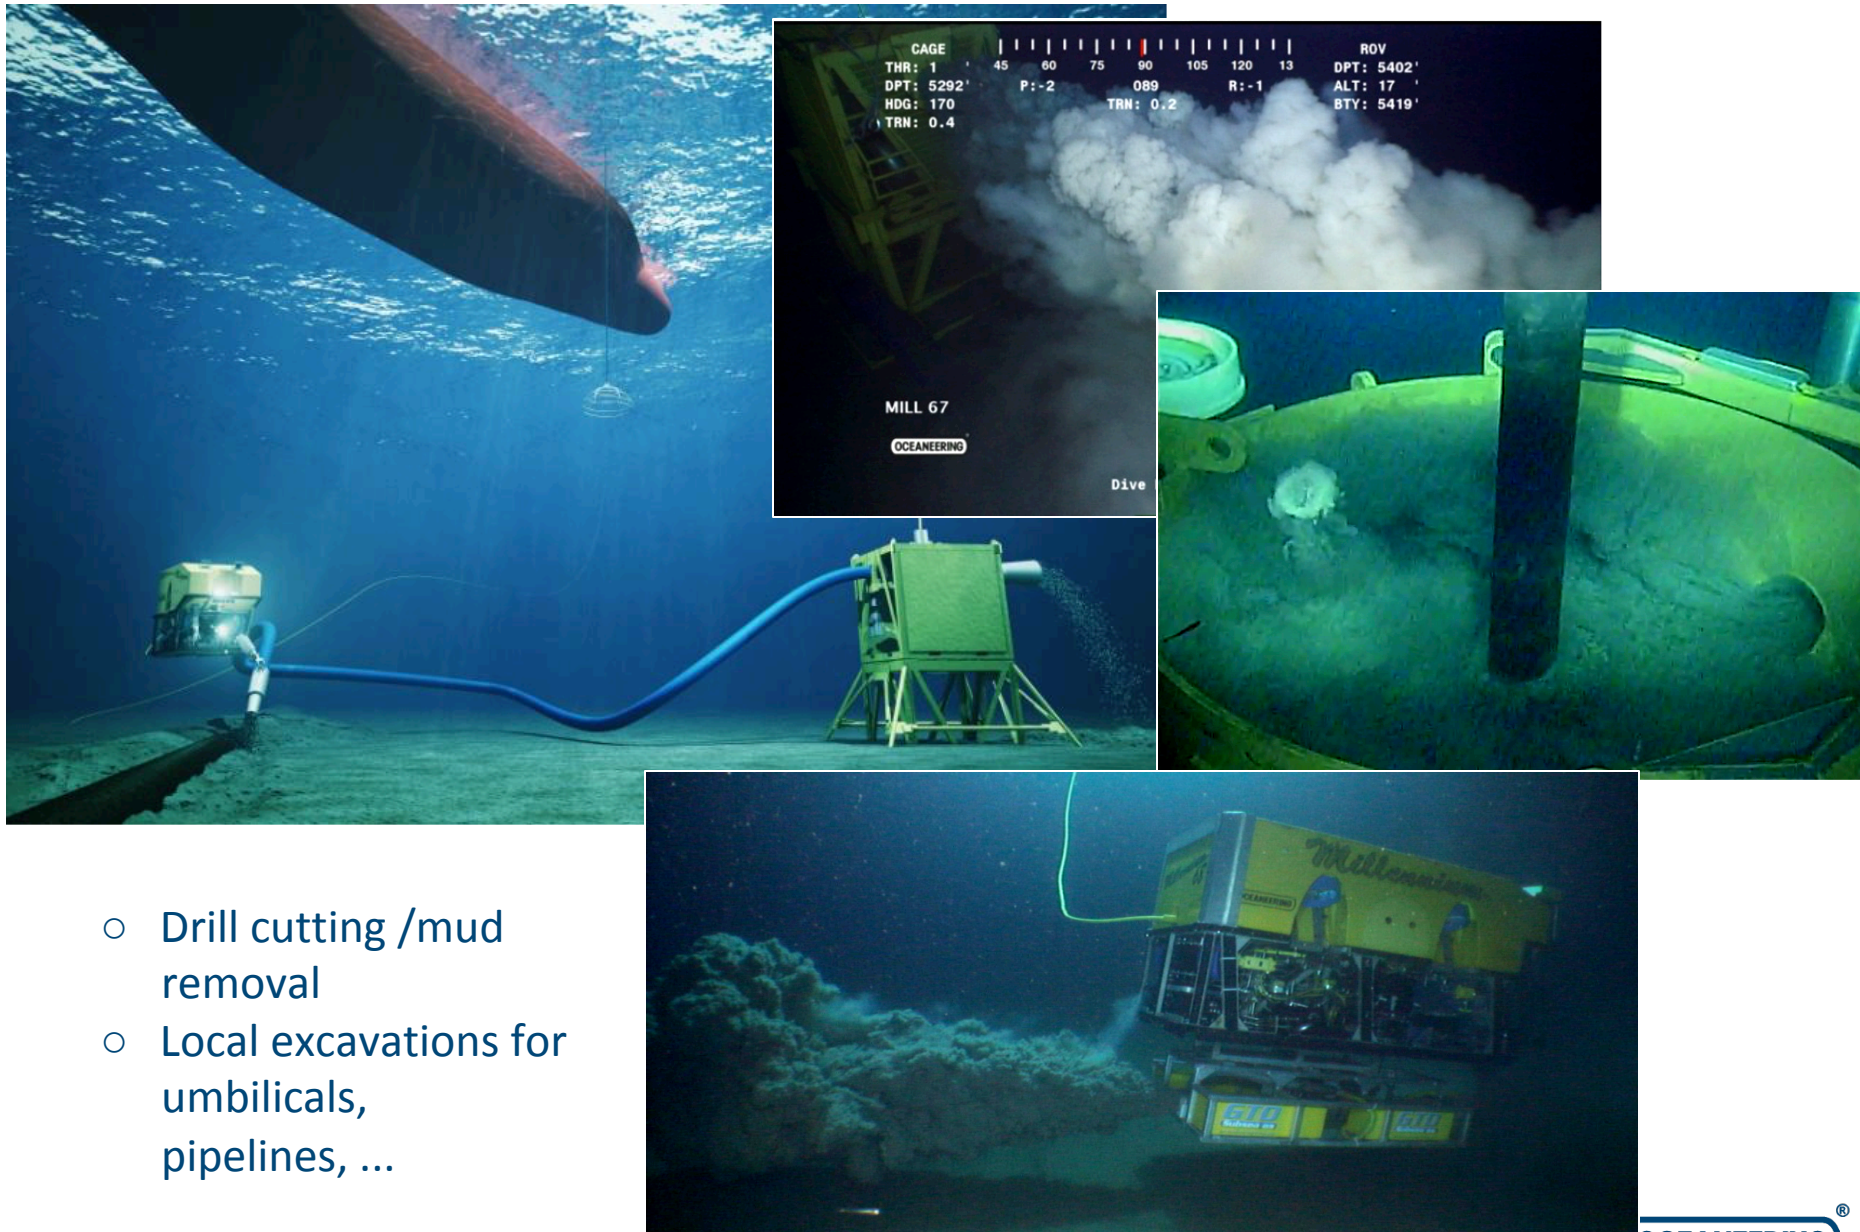

# Subsea Systems – Well Stimulation & Flowline Remediation

# Subsea Systems - Subsea Dredging

- Drill cutting /mud removal
- Local excavations for umbilicals, pipelines, ...

# Subsea Systems – Inspection and NDE

- Ultrasonic
- Digital Radiography
- Phase Array
- Guided Wave
- Pulsed Eddy Current
- Laser Scanning
- ...

# Eyeball Support

# A little help

# Autonomous Underwater Vehicles (AUVs)

- Military
  - Mine-hunting
  - Hull Scanning
  - Port security

## • Oil & Gas

- **Geohazard** Surveys: identify any conditions at the seabed or in the foundation zone where **hazardous** subsurface features or unstable soil conditions exist.
- **Pipeline** Surveys: pipelines and sub sea completions can be installed in the most cost **effective** manner with minimum disruption to the environment.
- **As-Built** Surveys: **verify** the condition of the pipeline shortly after its construction.
- **Block** Surveys: identify seafloor and subsurface features that may have an **adverse** effect on drilling operations.
- **Archaeological** Surveys: required in the Gulf of Mexico where proposed bottom-disturbing activities may impact submerged archaeological **resources**
- Deepwater **Benthic** Community Surveys: round-truthing of deepwater benthic communities to identify and localize, or disprove, their presence (clams, mussels, tubeworms, and other organisms that thrive in the absence of sunlight)
- **Government and Academic** Surveys: perform deepwater coral mapping, historic shipwreck surveys, and geotechnical investigations.

# Why AUVs?

- Ship – mounted sonars
  - Lack resolution in deep water
  - Sound “spreads” as distance to seafloor increases
- Towed sonars
  - Better resolution, but poor positioning
  - “Deep Tow” (>1000m)
    - Slow survey speed
    - Line turns = 6+hours
    - Difficult to adjust altitude
    - Logistics become harder

# The Survey AUV: Advantages

- Faster than “Deep Tow” 3-4kts
- Line turns = 5 minutes or less
- Constant altitude over seafloor – Better data
- Untethered – Can work closer to seafloor infrastructure
- Better positioning – support vessel remains in position to track it

# AUV – Very brief history

- First AUV developed at the Applied Physics Laboratory at the University of Washington as early as 1957
- "Special Purpose Underwater Research Vehicle", or SPURV, was used to study diffusion, acoustic transmission, and submarine wakes.

- Gliders
  - Ocean sampling missions - months
  - Small changes in its buoyancy in conjunction with wings to convert vertical motion to horizontal
  - Slocum, Seaglider, SeaExplorer, Spray
- Search Class
  - Lowest navigation and sensor resolution needs
  - Gavia, REMU 100, Iver OceanServer
- Survey Class
  - Survey grade navigation and sensors
  - C-Surveyors, Hugin 3000/4500, Hugin 1000
- Inspection Class
  - Inspection grade navigation solution and sensors
  - C-Surveyor VI

## The C-Surveyor AUV

# The Survey AUV: Challenges

- Launch and recovery
- Positioning and navigation
  - USBL positioning – acoustic range/bearing from support vessel
  - Doppler velocity log (DVL) – measures velocity of AUV over seafloor
  - Inertial Measurement Unit – acceleration of AUV
  - Digiquartz pressure – depth
  - Kalman filter – combines all position sensors
- Power
  - Batteries: duration, recharging, logistics
  - Better chemistry / efficiency = longer dives, more surveying
- Communications
  - No umbilical to send commands or receive status
- Software
  - Behavior programming: unplanned event handling

# Launch and Recovery

- Launched from sled, aft of vessel
- Recovery:
  - AUV drops “nose-cone”
  - Line connecting nose-cone to is grappled, and AUV towed to support vessel

- USBL: range and angle measured from vessel
  - Gives absolute geodetic position of AUV
  - Low update rate
- DVL: Velocity vector
- IMU: 3-D Accelerations
- Filtered solution: DVL/IMU updates position between USBL fixes
- Search class AUVs may use dead-reckoning, or return to surface for GPS position

# AUV Sensors: Multibeam

- Acoustic “time of flight” and angle measurements
- Depth is shown by color gradients or contour lines
- Requires accurate sound velocity sensor

# AUV Sensors: Sidescan Sonar

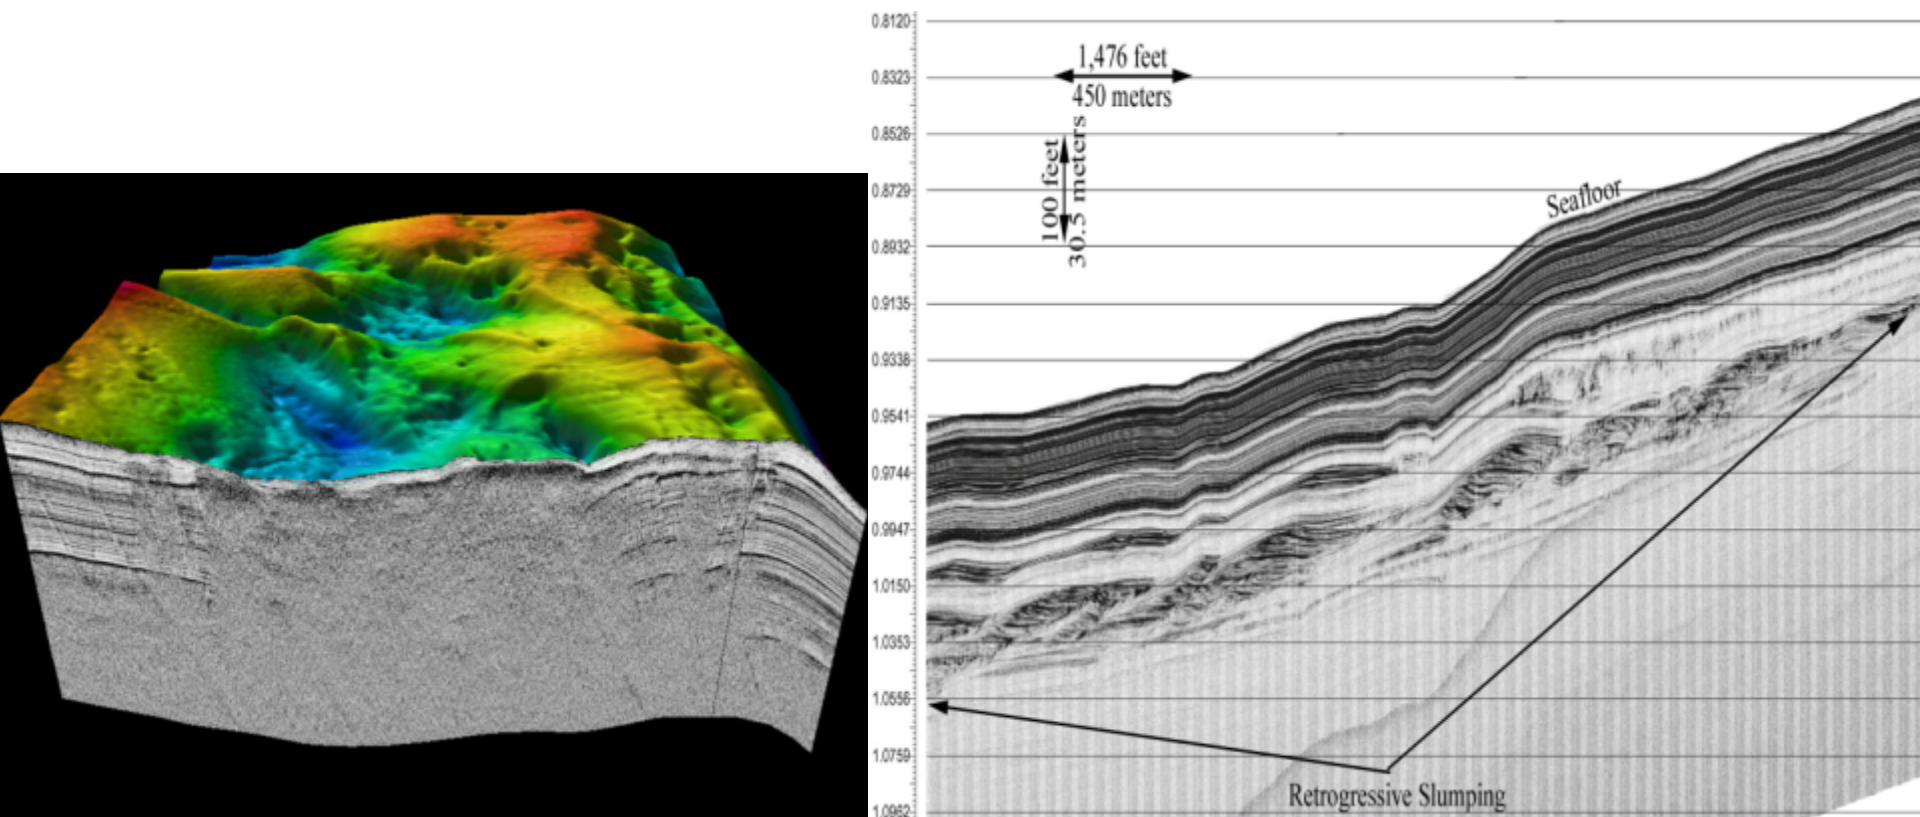

- Records intensity of reflected sound wave
- Stronger reflectors = rocks, hard bottom / weaker reflectors = mud, silt
- Can be used for target detection

# AUV Sensors: Subbottom Profiler

- Lower frequency acoustic – penetrates seafloor
- Used for seafloor classification, construction, burial

# AUV Sensors: Laser Bathymetry

- Laser Bathymetry
  - High resolution
  - Pipeline tracking

# AUV Sensors: Laser Bathymetry

# AUV Sensors: Camera

# AUV Sensors: Camera

# Autonomous Surface Vessels (ASVs)

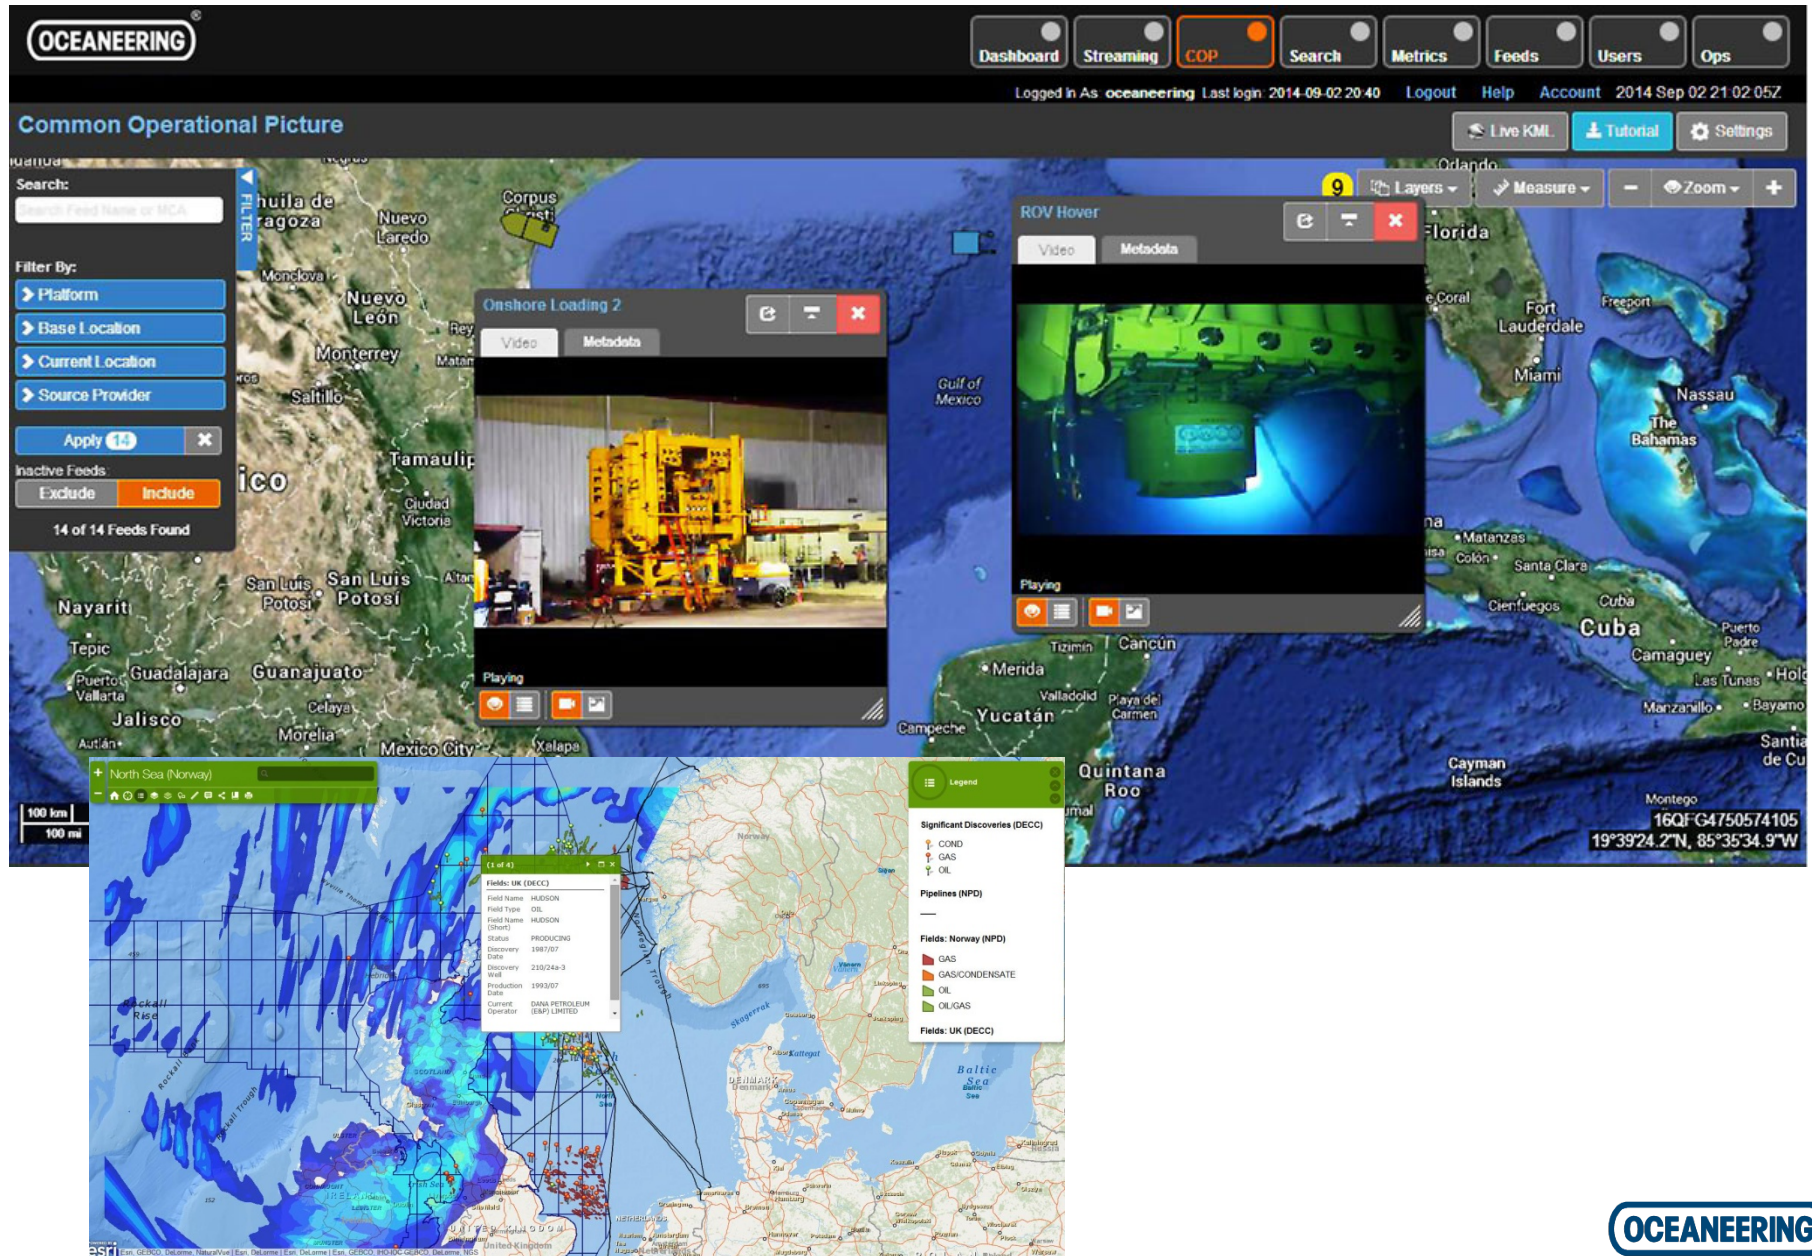

# ASV Applications

- Unmanned vessel advantages
  - Cost Effective
  - Safer (regions)
- Applications
  - Remote transmission station
  - Support AUV survey applications
  - Deploy and operate vehicles (ROVs, AUVs)
  - Surveillance: environmental
  - Coastal Container shipping
  - ...

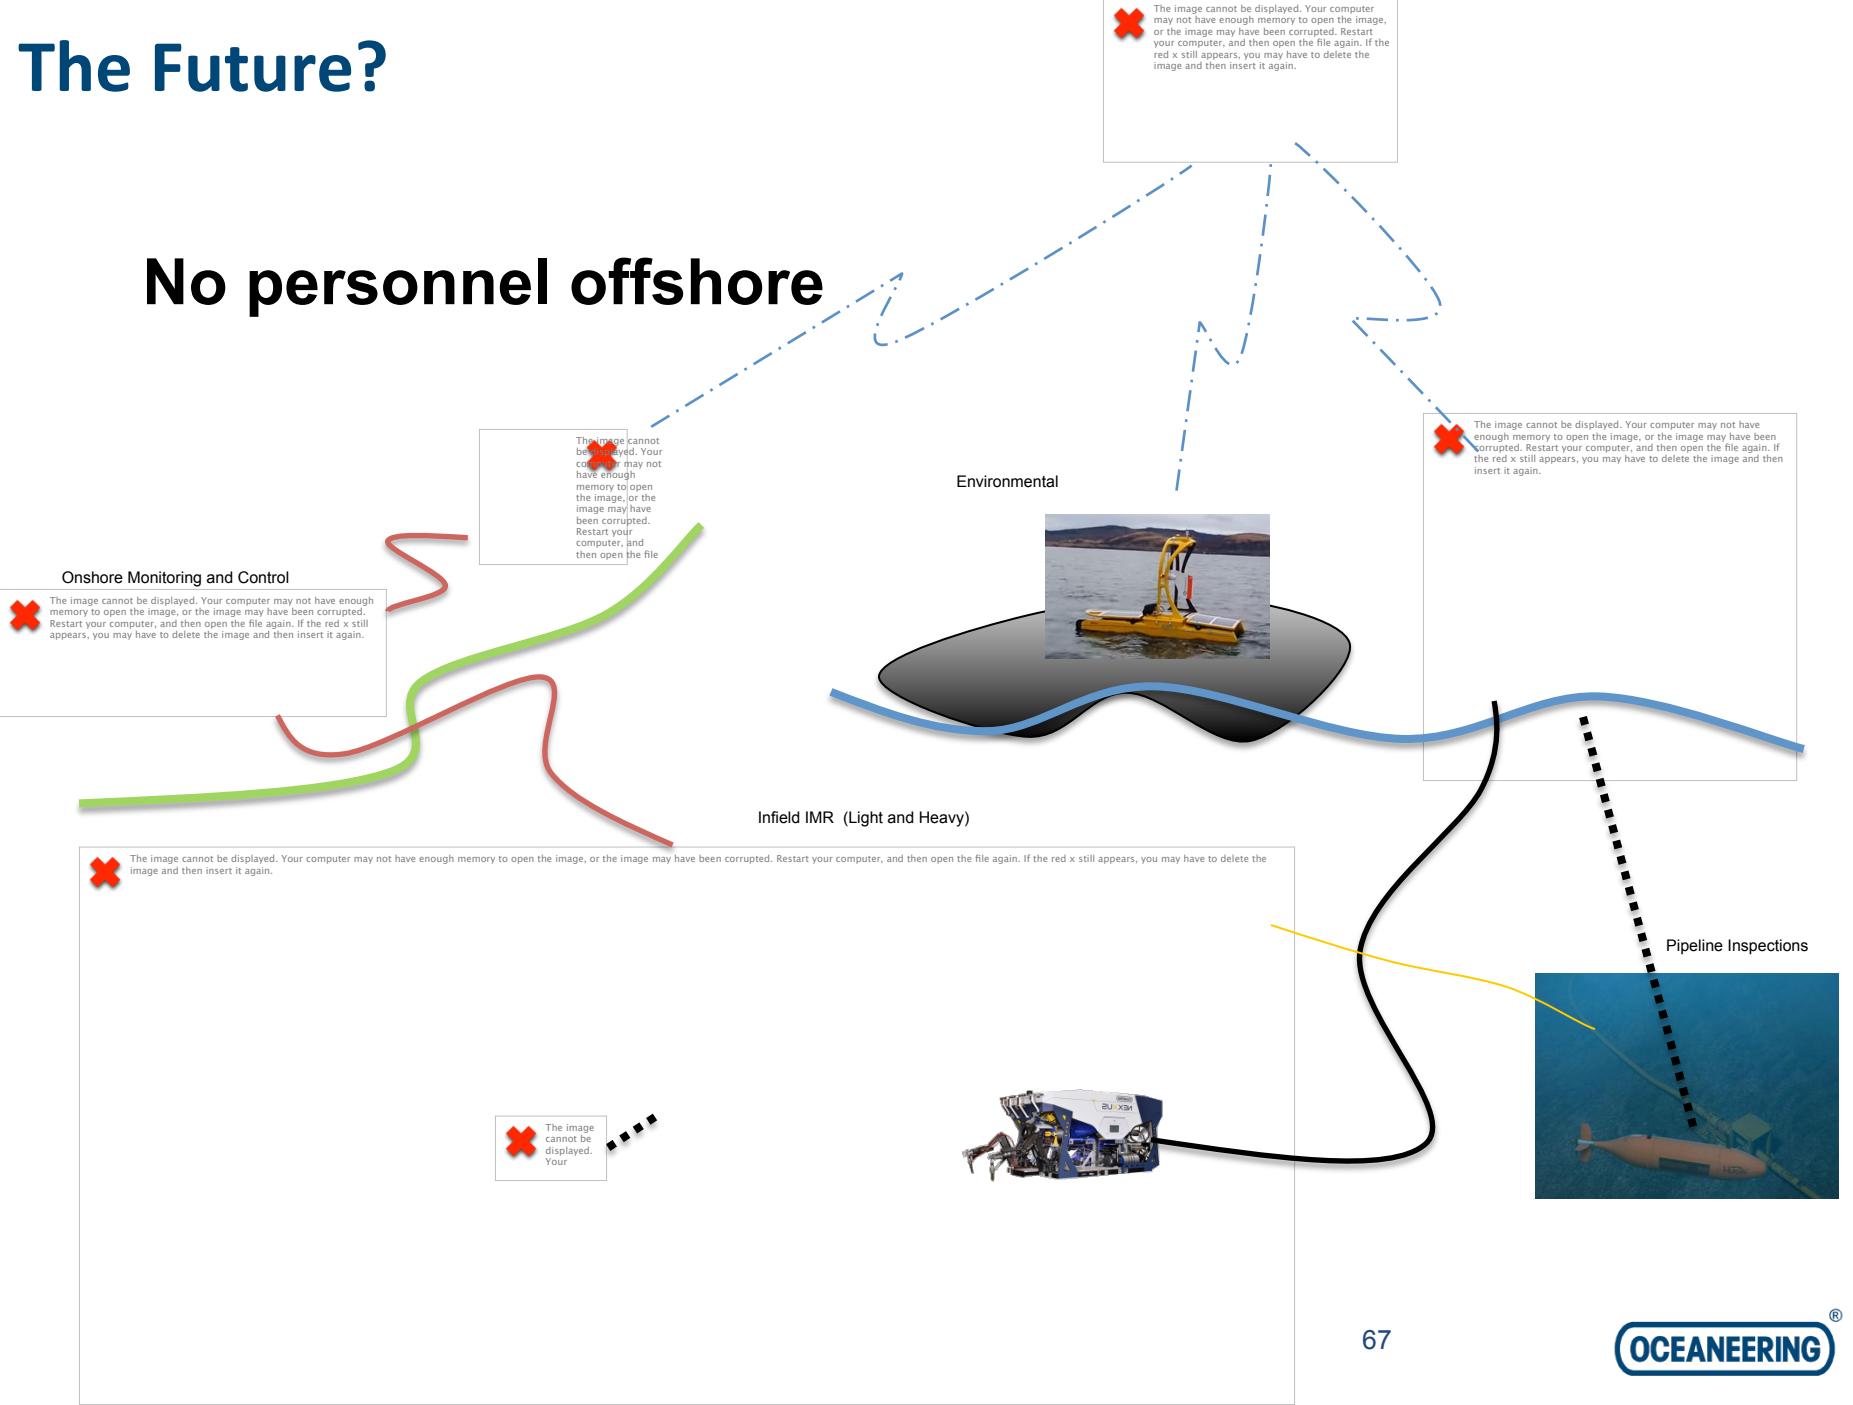

# Data Revolution

# The Future?

## No personnel offshore

**The End**

# Questions?

---
